

Available Resources:

In this section include all the available resources at your disposal for the execution of the proposal (Must use letter size, Verdana size 10 or similar).

Since clientelism and inequality represent the core of my research, and as my publications record suggests, part of the available resources I have come from my ongoing work and also from my published work. Publishing both Bahamonde (2018) and Bahamonde (2020) has helped me to connect with other scholars around the globe. This network of collaborators is an available resource that I intend to use when it comes to circulating the designs and papers in order to get feedback. These networks will also help me putting panels together at prestigious international conferences (REPAL, LASA, ACCP, APSA, MPSA, SPSA and WPSA).

Second, *Universidad de O'Higgins* generously granted a small research grant which allowed me to pilot some preliminary experimental designs programmed *Python* (a language commonly used in economic experiment). Part of this process led me to build a collaboration network with the the *Centro de Ciencias Experimentales Sociales* (CESS) which is a partnership between USACH and Oxford University. In fact the design along with the formal models have been already presented—see “Anexos for proof—at their colloquium. Since the CESS implements economic experiments, I intend to use this ongoing collaboration network to continue with the project described in this proposal.

It should be noted that the list experiment needs to be implemented in *Qualtrics*, a software to implement online surveys. Qualtrics is very pricey. Fortunately, not only I have already programmed the list experiment in *Qualtrics* but also I keep having access to this expensive software via my doctoral university. I believe I am saving a huge amount of money with this available resource.

In sum, part of my available resources (some software access, networks, preliminary experimental designs programmed in Python along with some already collected data) come from my ongoing work.

In addition, the *University* will provide the essentials (an office with a desk, Internet connection, and some access to some academic sources). The *University* will also provide excellent students from whom I will draw a research assistant and three (to four) thesis writers. This will be an important mentoring experience both for me, and my students. Importantly, it is also my goal to mentor and insert my research assistant in the academic world as much as possible. Proof of this is that I have already published an op-ed piece with one of my best students. She is a student in the public administration program—see proof of that in “Anexos.” Finally, the *University* will also provide the logistics for all public talks, i.e. an auditorium with a stage, some stage lights and some basic amplification for the microphones.
